

Global AI Trends 2026 - Internal Report

In 2026, the landscape of Artificial Intelligence has fundamentally shifted from parameter scaling to agentic capabilities. Large Language Models (LLMs) are no longer passive query responders; they are now autonomous orchestrators capable of breaking down complex tasks, searching enterprise knowledge bases using Retrieval-Augmented Generation (RAG), and executing actions via Model Context Protocol (MCP).

Our enterprise must adapt to this shift. Traditional software engineering is giving way to prompt engineering and AI-native system design. The integration of vector databases, such as Pinecone or Milvus, has become mandatory for maintaining stateful memory across sessions.

Table 1: Projected AI Budget Allocation

Department	2025 Budget	2026 Budget
R&D	\$12M	\$25M
Marketing	\$5M	\$4M
IT Ops	\$8M	\$15M
